

# E10 Test Specification for Type Approval

(1991)  
 (Rev.1  
 1993)  
 (Rev.2  
 1997)  
 (Rev. 2.1  
 July 1999)  
 (Rev.3  
 May 2001)  
 (Corr.1  
 July 2003)  
 (Rev.4  
 May 2004)  
 (Rev.5  
 Dec 2006)  
 (Rev.6  
 Oct 2014)  
 (Rev.7  
 Oct 2018)

## E10.1 General

This Test Specification is applicable, but not confined, to electrical, electronic and programmable equipment intended for control, monitoring, alarm and protection systems for use in ships.

## E10.2 Testing

These tests are to demonstrate the ability of the equipment to function as intended under the specified testing conditions.

The extent of the testing (i.e. the selection and sequence of carrying out tests and number of pieces to be tested) is to be determined upon examination and evaluation of the equipment or component subject to testing giving due regard to its intended usage.

Equipment is to be tested in its normal position if otherwise not specified in the test specification.

---

### Note:

1. Rev.5 of this UR is to be uniformly implemented by IACS Societies from 1 January 2008.
2. Rev.6 of this UR is to be uniformly implemented by IACS Societies from 1 January 2016.
3. Rev.7 of this UR is to be uniformly implemented by IACS Societies for equipment for which the date of application for type approval certification is dated on or after 1 January 2020.
4. Equipment intended to be installed on ships contracted for construction on or after 1 January 2022 is to comply with Rev.7 of this UR.
5. The “contracted for construction” date means the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. For further details regarding the date of “contract for construction”, refer to IACS Procedural Requirement (PR) No. 29.
6. The “date of application for type approval” is the date of documents accepted by the Classification Society as request for type approval certification of a new equipment type or of an equipment type that has undergone substantive modifications in respect of the one previously type approved, or for renewal of an expired type approval certificate.

# E10

(cont)

Relevant tests are as listed in the Table.

Note:

- a) \* These test requirements are harmonised with IEC 60092-504 “Electrical Installations in Ships - Part 504: Special features - Control and Instrumentation” and IEC 60533 “Electrical and electronic installations in ships – electromagnetic compatibility”. Electrical and electronic equipment on board ships, required neither by classification rules nor by International Conventions, liable to cause electromagnetic disturbance shall be of type which fulfil the test requirements of test specification items 19 and 20.
- b) As used in this document, and in contrast to a complete performance test, a functional test is a simplified test sufficient to verify that the equipment under test (EUT) has not suffered any deterioration caused by the individual environmental tests.

### Type testing condition for equipment covered by E10.1

NO.	TEST	PROCEDURE ACC. TO:*	TEST PARAMETERS	OTHER INFORMATION
* indicates the testing procedure which is normally to be applied. However, equivalent testing procedure may be accepted by the individual Society provided that the Unified Requirements stated in the other columns are fulfilled. The latest edition of the normative reference applies.				
1.	Visual inspection	-	-	- conformance to drawings, design data
2.	Performance test	Manufacturer performance test programme based upon specification and relevant Rule requirements. When the EUT is required to comply with an international performance standard, e.g. protection relays, verification of requirements in the standard are to be part of the performance testing required in this initial test and subsequent performance tests after environmental testing where required in the UR.	- standard atmosphere conditions - temperature: 25°C ± 10°C - relative humidity: 60% ± 30% - air pressure: 96 KPa ± 10KPa	- confirmation that operation is in accordance with the requirements specified for particular system or equipment; - checking of self-monitoring features; - checking of specified protection against an access to the memory; - checking against effect of unerroneous use of control elements in the case of computer systems.

NO.	TEST	PROCEDURE ACC. TO:*	TEST PARAMETERS	OTHER INFORMATION
5.	Dry heat (see note 1)	IEC 60068-2-2 <u>Test Bb for non-heat dissipating equipment</u>	Temperature: 55° ± 2°C Duration: 16 hours or Temperature: 70°C ± 2°C Duration: 16 hours (see note 1)	<ul style="list-style-type: none"> <li>- equipment operating during conditioning and testing;</li> <li>- functional test (b) during the last hour at the test temperature.</li> <li>- for equipment specified for increased temperature the dry heat test is to be conducted at the agreed test temperature and duration.</li> </ul>
		IEC 60068-2-2 <u>Test Be for heat dissipating equipment</u>	Temperature: 55° ± 2°C Duration: 16 hours or Temperature: 70°C ± 2°C Duration: 16 hours	<ul style="list-style-type: none"> <li>- equipment operating during conditioning and testing with cooling system on if provided;</li> <li>- functional test (b) during the last hour at the test temperature.</li> <li>- for equipment specified for increased temperature the dry heat test is to be conducted at the agreed test temperature and duration.</li> </ul>
6.	Damp heat	IEC 60068-2-30 test D <sub>b</sub>	Temperature: 55°C Humidity: 95% Duration: 2 cycles 2 x (12 +12 hours)	<ul style="list-style-type: none"> <li>- measurement of insulation resistance before test;</li> <li>- the test shall start with 25°C ± 3°C and at least 95% humidity;</li> <li>- equipment operating during the complete first cycle and switched off during second cycle except for functional test;</li> <li>- functional test during the first 2 hours of the first cycle at the test temperature and during the last 2 hours of the second cycle at the test temperature; Duration of the second cycle can be extended due to more convenient handling of the functional test.</li> <li>- recovery at standard atmosphere conditions;</li> <li>- insulation resistance measurements and performance test.</li> </ul>
7.	Vibration	IEC 60068-2-6 Test F <sub>c</sub>	<p>2<sup>+3</sup> Hz to 13.2 Hz – amplitude ±1mm<sub>-0</sub></p> <p>13.2 Hz to 100 Hz – acceleration ± 0.7 g. For severe vibration conditions such as, e.g. on diesel engines, air compressors, etc.:</p> <p>2.0 Hz to 25 Hz – amplitude ±1.6 mm 25.0 Hz to 100 Hz – acceleration ± 4.0 g.</p>	<ul style="list-style-type: none"> <li>- duration in case of no resonance condition 90 minutes at 30 Hz;</li> <li>- duration at each resonance frequency at which Q ≥ 2 is recorded - 90 minutes;</li> <li>- during the vibration test, functional tests are to be carried out;</li> <li>- tests to be carried out in three mutually perpendicular planes;</li> <li>- it is recommended as guidance that Q does not exceed 5.</li> </ul>

E10  
(cont)

NO.	TEST	PROCEDURE ACC. TO:*	TEST PARAMETERS	OTHER INFORMATION
			<p>Note: More severe conditions may exist for example on exhaust manifolds or fuel oil injection systems of diesel engines. For equipment specified for increased vibration levels the vibration test is to be conducted at the agreed vibration level, frequency range and duration. Values may be required to be in these cases 40 Hz to 2000 Hz - acceleration <math>\pm 10.0g</math> at 600°C, duration 90 min.*</p>	<p>- where sweep test is to be carried out instead of the discrete frequency test and a number of resonant frequencies is detected close to each other, duration of the test is to be 120 min. Sweep over a restricted frequency range between 0.8 and 1.2 times the critical frequencies can be used where appropriate. Note: Critical frequency is a frequency at which the equipment being tested may exhibit:</p> <ul style="list-style-type: none"> <li>- malfunction and/or performance deterioration</li> <li>- mechanical resonances and/or other response effects occur, e.g. chatter</li> </ul>
8.	Inclination	IEC 60092-504	<p>Static 22.5°</p> <p>Dynamic 22.5°</p>	<p>a) inclined to the vertical at an angle of at least 22.5° b) inclined to at least 22.5° on the other side of the vertical and in the same plane as in (a), c) inclined to the vertical at an angle of at least 22.5° in plane at right angles to that used in (a), d) inclined to at least 22.5° on the other side of the vertical and in the same plane as in (c). Note: The period of testing in each position should be sufficient to fully evaluate the behaviour of the equipment.</p> <p>Using the directions defined in a) to d) above, the equipment is to be rolled to an angle of 22.5° each side of the vertical with a period of 10 seconds. The test in each direction is to be carried out for not less than 15 minutes. On ships for the carriage of liquified gases and chemicals, the emergency power supply is to remain operational with the ship flooded up to a maximum final athwart ship inclination of 30°.</p> <p>Note: These inclination tests are normally not required for equipment with no moving parts.</p>

Notes:

1. ~~Equipment to be mounted in consoles, housing etc. together with other equipment are to be tested with 70°C.~~ Dry heat at 70 °C is to be carried out to automation, control and instrumentation equipment subject to high degree of heat, for example mounted in consoles, housings, etc. together with other heat dissipating power equipment.
2. For equipment installed in non-weather protected locations or cold locations test is to be carried out at -25°C.
3. Salt mist test is to be carried out for equipment installed in weather exposed areas.
4. Performance Criterion B: (For transient phenomena): The EUT shall continue to operate as intended after the tests. No degradation of performance or loss of function is allowed as defined in the technical specification published by the manufacturer. During the test, degradation or loss of function or performance which is self recoverable is however allowed but no change of actual operating state or stored data is allowed.
5. Performance Criterion A: (For continuous phenomena): The Equipment Under Test shall continue to operate as intended during and after the test. No degradation of performance or loss of function is allowed as defined in relevant equipment standard and the technical specification published by the manufacturer.
6. For equipment installed on the bridge and deck zone, the test levels shall be increased to 10V rms for spot frequencies in accordance with IEC 60945 at 2, 3, 4, 6.2, 8.2, 12.6, 16.5, 18.8, 22, 25 MHz.
